Dr John R. Taylor, Mrs. Desiré J. Taylor

ABSTRACT

In recent years global warming has been a highly controversial topic, and opinions range from thinking global warming is a hoax to thinking that the world will end from it before the end of this century. Now, much of the controversy has shifted to the severity and causes of global warming. This paper looks at the causes of global warming. Then using the official annual global land temperature anomaly data from the National Climatic Data Center and a linear regression model determines that global warming is has a positive linear correlation over time.
